

1. PCA

$$\min_{u, \{v_k\}} \sum_{i=1}^n \|x_i - u - v_k\|^2 \quad v_k \text{ is } d \times k \text{ orthogonal}$$

First fix u , let $\tilde{x}_i = x_i - u$. Now $\min_{\{v_k\}} \sum_{i=1}^n \|\tilde{x}_i - v_k\|^2$

Claim: the minimizer is $\hat{x}_i = v_k^T \tilde{x}_i$

Proof: $\|b - Ax\|^2$ is minimized when $A^T A x = A^T b$ $b \in \mathbb{R}^k$, $A \in \mathbb{R}^{k \times d}$, $x \in \mathbb{R}^d$

Let $\mathcal{R}(A) = \{y \in \mathbb{R}^k : y = Ax, x \in \mathbb{R}^d\}$.

$$\mathcal{R}(A)^\perp = \{x \in \mathbb{R}^d : Ax = 0\}$$

Then $\mathbb{R}^k = \mathcal{R}(A) \oplus \mathcal{R}(A)^\perp$.

$b \in \mathbb{R}^k$ can be written as $b = b_1 + b_2$, where $b_1 \in \mathcal{R}(A)$, $b_2 \in \mathcal{R}(A)^\perp$

$b_1 = Ax \in \mathcal{R}(A)$.

$$\begin{aligned} \|b - Ax\|^2 &= \|b_1 - Ax + b_2\|^2 = \|b_1 - Ax\|^2 + \|b_2\|^2 + \underbrace{(b_1 - Ax)^T b_2}_{=0} + \underbrace{b_2^T (b_1 - Ax)}_{=0} \\ &= \|b_1 - Ax\|^2 + \|b_2\|^2 \end{aligned}$$

$\|b - Ax\|^2$ is minimized when $\|b_1 - Ax\|^2$ is minimized.

$b_1 = Ax$ has a solution

$$\begin{aligned} x &= A^T b_1 = A^T b_1 + A^T b_2 \quad \text{since } A^T b_2 = 0 \\ &= A^T b. \end{aligned}$$

Thus, $A^T A x = A^T b$.

$x = A^T b$ is the minimizer of $\|b - Ax\|^2$

Going back to our problem, $\hat{x}_i = v_k^T \tilde{x}_i$ is the minimizer of $\|\tilde{x}_i - v_k\|^2$, thus the minimizer of $\sum_{i=1}^n \|\tilde{x}_i - v_k\|^2$.

Then we want to minimize $\sum_{i=1}^n \|x_i - u - v_k^T (x_i - u)\|^2 = \sum_{i=1}^n \|(I - v_k v_k^T)(x_i - u)\|^2$

$$\begin{aligned} Df(u) &= \sum_{i=1}^n 2(I - v_k v_k^T)(x_i - u) \cdot (I - v_k v_k^T) \cdot (-1) = 2(I - v_k v_k^T)^2 \cdot \left(u - \frac{1}{n} \sum_{i=1}^n x_i\right) \\ &\Rightarrow Df(u) = 0 \quad \text{when } u = \frac{1}{n} \sum_{i=1}^n x_i, \\ &\Rightarrow \hat{u} = \frac{1}{n} \sum_{i=1}^n x_i \end{aligned}$$

So $\hat{u} = \frac{1}{n} \sum_{i=1}^n x_i$ are the minimizers. \hat{u} is not unique because as long as it satisfies $(I - v_k v_k^T)^2 (u - \bar{x}) = 0$, the loss is minimized.

2. Lasso.

$$f(\beta) = -t\beta + \frac{1}{2}\beta^2 + \lambda|\beta|$$

WTS: the minimizer of $f(\beta)$ is $\beta = \text{sign}(t)[|t| - \lambda]_+$

Break it into the following 4 cases:

①. $t > 0, |t| - \lambda > 0$

$$f(\beta) = \begin{cases} \frac{1}{2}\beta^2 + (\lambda - t)\beta & \beta > 0 \\ \frac{1}{2}\beta^2 - (\lambda + t)\beta & \beta < 0 \end{cases}$$

when $\beta > 0$, $\beta_{*+} = -\frac{\lambda - t}{\frac{1}{2} \times 2} = t - \lambda > 0$

when $\beta < 0$, $\beta_{*-} = -\frac{-(\lambda + t)}{\frac{1}{2} \times 2} = \lambda + t$ <1> if $\lambda + t > 0$

the minimizer of $f(\beta)$

is $t - \lambda$.

$= |t| - \lambda$

$= +[|t| - \lambda]_+$

$= \text{sign}(t)[|t| - \lambda]_+$

<2> if $\lambda + t < 0$.

$$f(\beta_{*+}) = \frac{1}{2}\beta^2 + (\lambda - t)(t - \lambda)$$

$$= \frac{1}{2}\beta^2 + (\lambda - t)^2$$

$$f(\beta_{*-}) = \frac{1}{2}\beta^2 + (\lambda + t)^2$$

$f(\beta_{*+}) < f(\beta_{*-})$ because $(\lambda + t)^2 < (\lambda - t)^2$

So the minimizer is $\beta_{*+} = t - \lambda = \text{sign}(t)[|t| - \lambda]_+$

②. $t > 0, |t| - \lambda \leq 0$

$$f(\beta) = \begin{cases} \frac{1}{2}\beta^2 + (\lambda - t)\beta & \beta > 0 \\ \frac{1}{2}\beta^2 - (\lambda + t)\beta & \beta < 0 \end{cases}$$

$\beta_{*+} = t - \lambda < 0$

$\beta_{*-} = t + \lambda > 0$

the minimizer is $\beta = 0 = +0 = +[|t| - \lambda]_+ = \text{sign}(t)[|t| - \lambda]_+$

③. $t < 0, |t| - \lambda < 0$

$$f(\beta) = \begin{cases} \frac{1}{2}\beta^2 + (\lambda - t)\beta & \beta > 0 \\ \frac{1}{2}\beta^2 - (\lambda + t)\beta & \beta < 0 \end{cases}$$

$$\beta_{*+} = t - \lambda < 0 \text{ because } \left. \begin{matrix} |t| - \lambda < 0 \\ t < 0 \end{matrix} \right\} \Rightarrow -\lambda - t < 0 \Rightarrow -(\lambda + t) < 0 \Rightarrow \frac{\lambda + t > 0}{t < 0} \Rightarrow \lambda > 0 \Rightarrow t - \lambda < 0$$

$$\beta_{*-} = t + \lambda > 0$$

the minimizer is $\beta = 0 = -0 = -[|t| - \lambda]_+$
 $= \text{sign}(t)[|t| - \lambda]_+$

④. $t < 0, |t| - \lambda > 0$

$$f(\beta) = \begin{cases} \frac{1}{2}\beta^2 + (\lambda - t)\beta & \beta > 0 \\ \frac{1}{2}\beta^2 - (\lambda + t)\beta & \beta < 0 \end{cases}$$

$$\beta_{*-} = t + \lambda < 0 \text{ because } \left. \begin{matrix} |t| - \lambda > 0 \\ t < 0 \end{matrix} \right\} \Rightarrow -t - \lambda > 0 \Rightarrow t + \lambda < 0$$

$$\beta_{*+} = t - \lambda < 0 \text{ if } t - \lambda < 0, \lambda > 0$$

the minimizer is

$$\begin{aligned} \beta_{*-} &= t + \lambda \\ &= -|t| + \lambda \\ &= -(|t| - \lambda) \\ &= -[|t| - \lambda]_+ \\ &= \text{sign}(t)[|t| - \lambda]_+ \end{aligned}$$

<2>. if $t - \lambda > 0, \lambda < 0$.

$$f(\beta_{*+}) = \frac{1}{2}\beta^2 - (t - \lambda)^2$$

$$f(\beta_{*-}) = \frac{1}{2}\beta^2 - (\lambda + t)^2$$

$$\text{Since } t < 0, \lambda < 0, |\lambda + t| > |t - \lambda|$$

$$(\lambda + t)^2 > (t - \lambda)^2$$

$$f(\beta_{*-}) < f(\beta_{*+})$$

So the minimizer is $\beta_{*-} = t + \lambda = \text{sign}(t)[|t| - \lambda]_+$

Based on ①, ②, ③, ④, the minimizer of $f(\beta)$ is $\beta = \text{sign}(t)[|t| - \lambda]_+$
